Analog and Digital Communications

1. **Course number and name:** 020CONES3 Analog and Digital Communications

2. **Credits and contact hours:** 6 ECTS credits, 2x1:15 contact hours + 2:30 lab hours

3. **Instructor’s or course coordinator’s name:** Hadi Sawaya

4. **Text book:**
   a. **Other supplemental materials:**
      Professor textbook and course material

5. **Specific course information**
   a. **Catalog description:**

   b. **Prerequisites:** 020THSES2 Signal theory

   c. **Required:** Required for CCE students

6. **Specific goals for the course**
   a. **Specific outcomes of instruction:**
      - Describe the modulation and demodulation technics used in analog and digital communications: AM, SSB, FM, PAM, QAM, PSK, ASK, MSK, FSK, and OFDM.
      - Analyze and calculate the power consumption of an analog or digital communication system.
      - Evaluate the performance of a communication system in presence of noise by calculation the signal to noise ratio in an analog communication system or the error probability in a digital communication system.
      - Analyze the effects of the linear distortions introduced by the channel, like crosstalk and ISI, and apply the reception technics for selective channels like equalization and OFDM.
      - Recognize the synchronization problems.
- Recognize the fading problem in mobile communications and the technics used to overcome this problem.

b. **KPI addressed by the course:**

7. **Topics and approximate lecture hours:**

- Narrow band signals, AM and SSB modulations: spectrum, bandwidth, modulation, demodulation (2 lectures)
- Frequency modulation (FM): spectrum, bandwidth, Armstrong modulator, discriminator, Phase Locked Loop, Receiver structure, stereo signal (5 lectures)
- Signal to noise ratio calculation for the different modulations (2 lectures)
- Structure of a digital communication system, baseband PAM modulation, QAM, PSK, ASK, MSK and FSK modulations (5 lectures)
- Coherent reception of linear modulations, narrow band and base band models, linear distortions introduced by the channel, crosstalk, Inter Symbol Interference (ISI), Eye diagram, Nyquist channel, raised cosine function (3 lectures)
- Reception in presence of noise, maximum likelihood a posteriori detector, adapted filter, Symbol and Bit Error Rate calculation (3 lectures)
- Reception in presence of ISI, Zero-Forcing and Mean Square Error equalizers, Decision Feedback Equalizers (3 lectures)
- Selective channels, OFDM modulation, performance of digital modulations over a Rayleigh flat fading channel, Diversity, Introduction to MIMO channels, Alamouti scheme (3 lectures)
- Introduction to carrier and symbol synchronization (2 lectures)
- Lab: SDR and USRP radio with Matlab, frequency offset problems and compensation in coherent demodulation, AM modulation and demodulation using SDR, Frequency modulation and demodulation, Phase Locked Loop, Digital base band transmission, Source coding using delta and adaptive delta encoders, Simulation of a digital communications system using Matlab, Performance of digital modulations in the presence of noise, adaptive filtering (10 Lab lectures of 2:30 hours each)
